# Bushfire Alert! Branches on Powerlines

PRESENTED BY SEVVANDI KANDANAARACHCHI  
SCHOOL OF SCIENCE, MATHEMATICAL SCIENCES  
RMIT UNIVERSITY, MELBOURNE, AUSTRALIA

# After the Black Saturday Bushfires 2009

Powerline Bushfire Safety Program

Research on how fires can start from  
powerlines

Experiments in a container

Record the current (LF, HF) and  
voltage (LF, HF)

If a branch falls on a  
powerline, can we predict  
if it ignites or not?

---

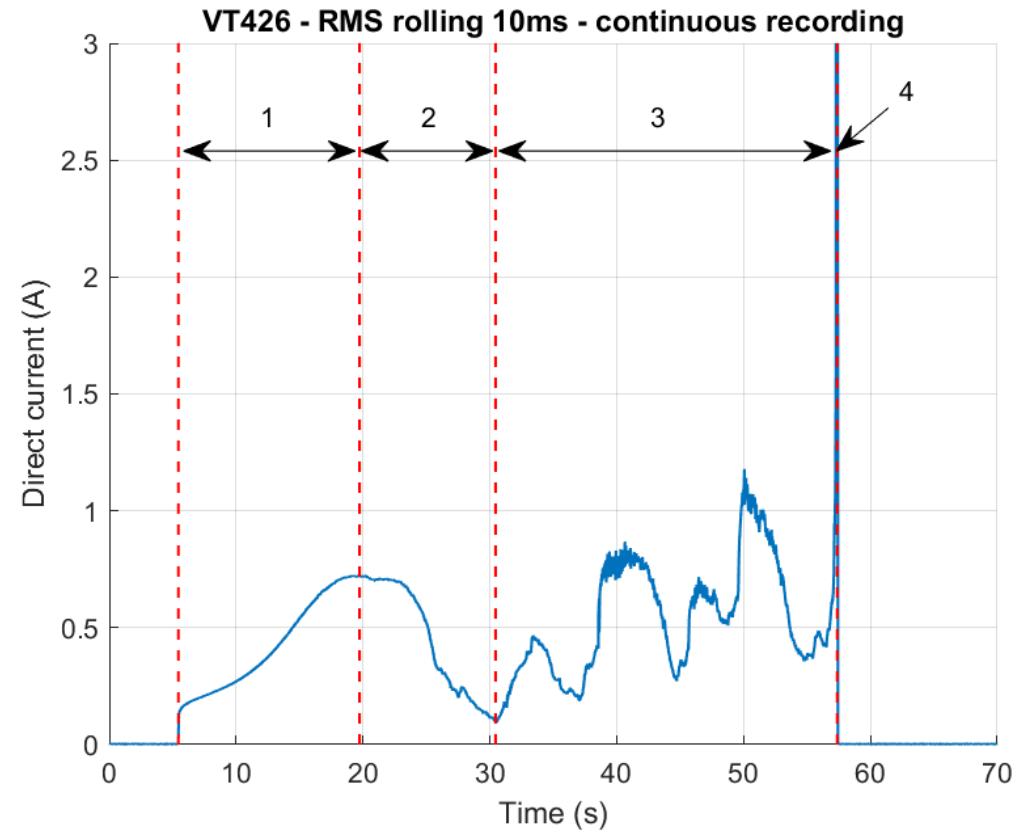

Raw Data

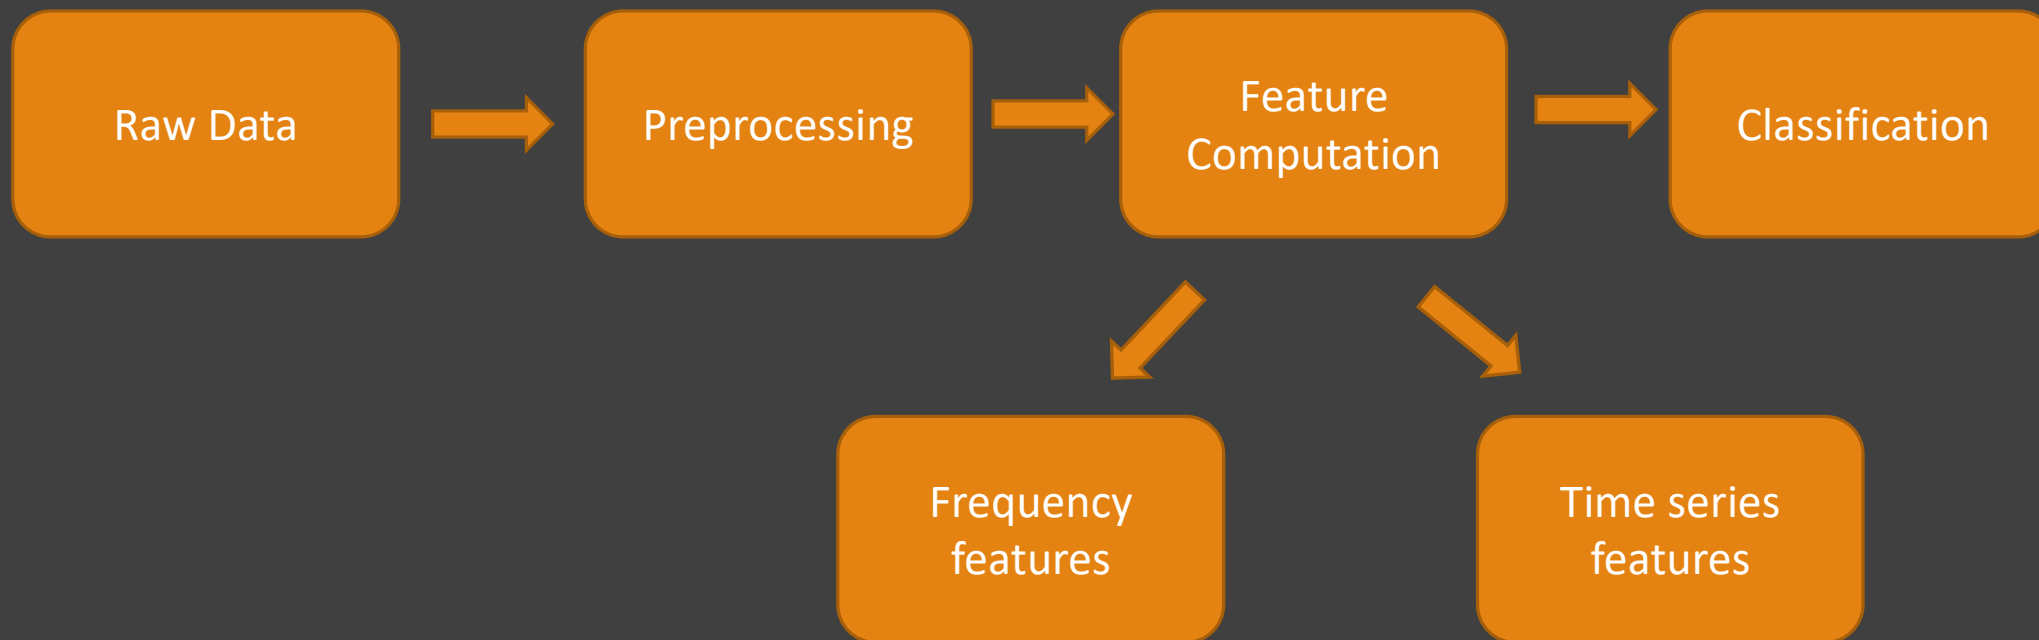

Preprocessing

Using half of phase 1 data, can we predict ignition?

Ignition after phase 1

# Features

## Time series features using *tsfeatures* R package

- Spikiness, linearity, curvature, autocorrelation etc  
...
- 112 features

## Frequency domain features

- Fast Fourier Transform
- Frequency bands
- Summary statistics of the amplitude of each band
- 128 features

# Classification

---

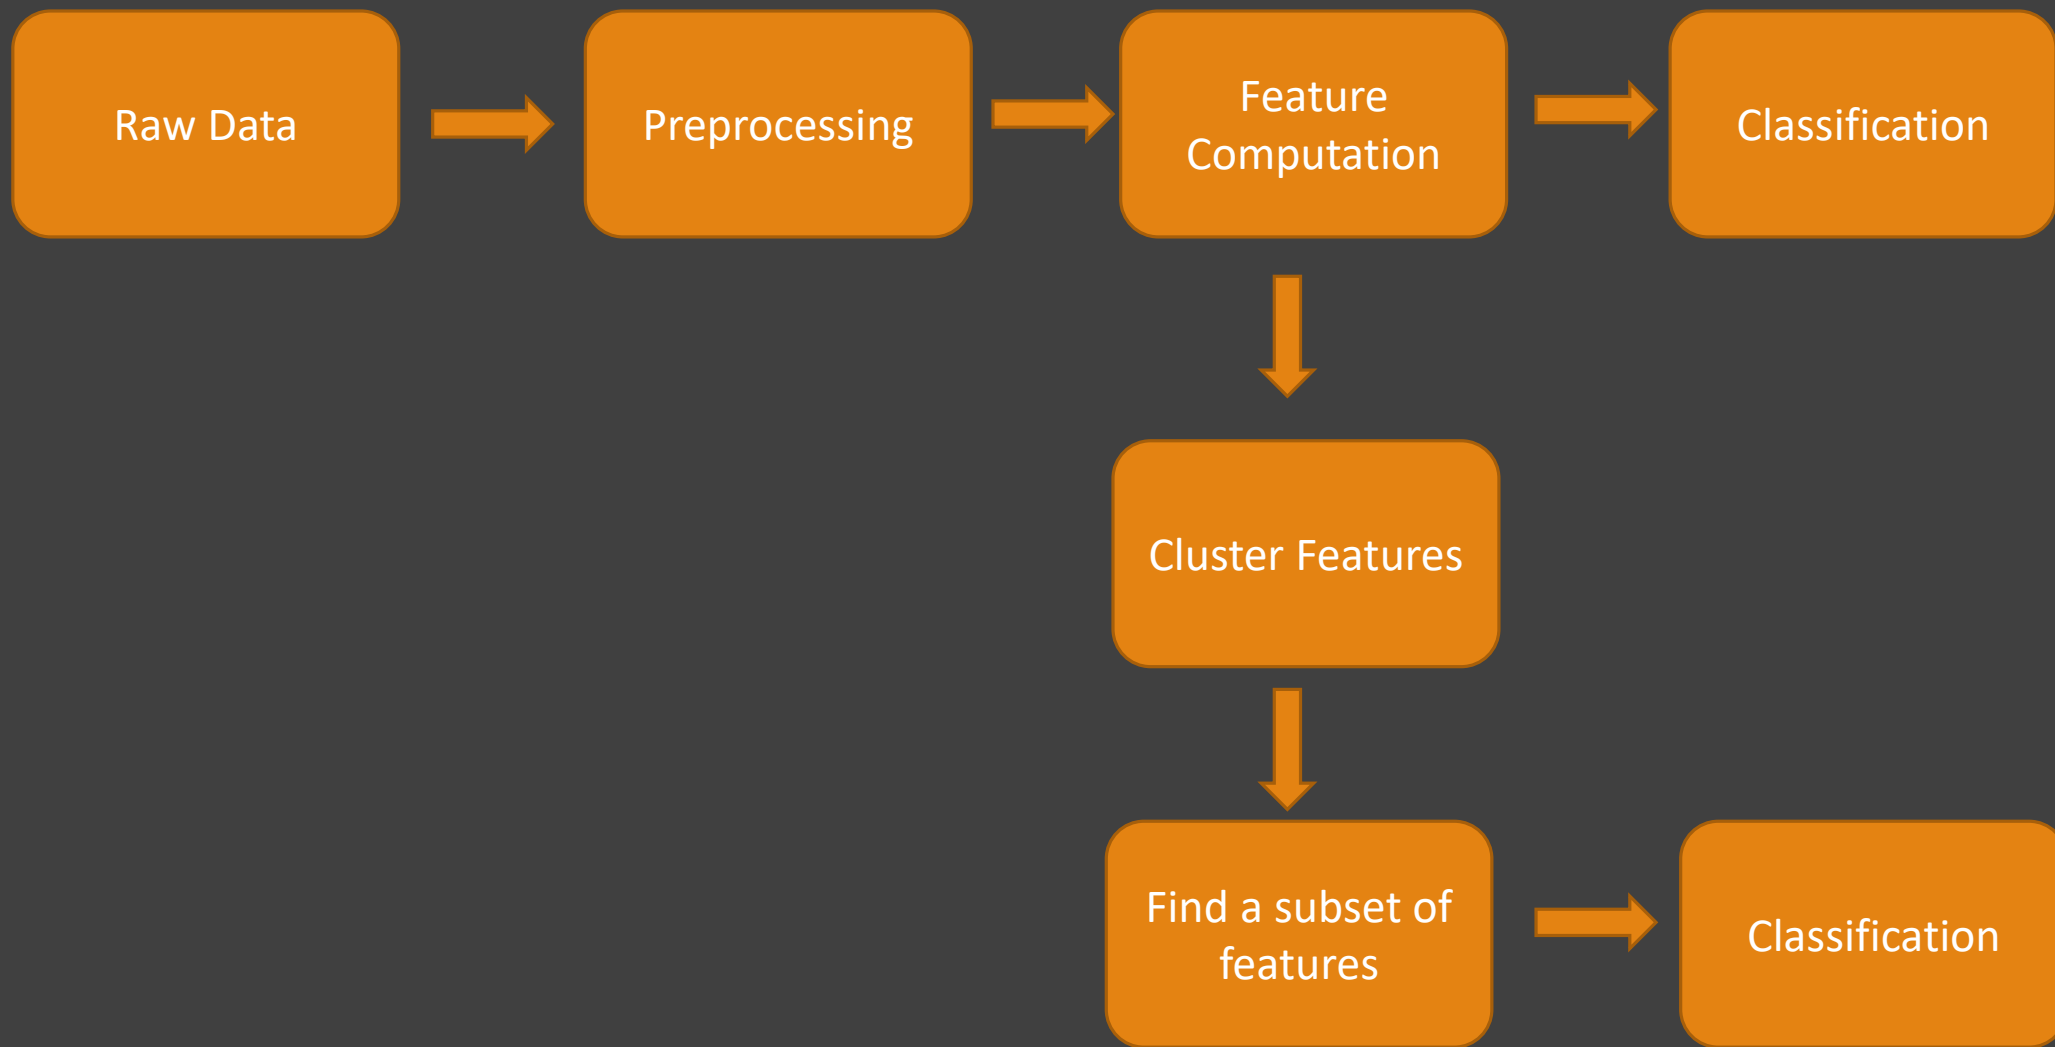

Using a Randomforest model

10-fold cross validation

Using half of the Phase 1 data

Tests	Mean CV Accuracy %
All tests	83.3
Tests with phase 1 time > 4s	86.1
Tests with phase 1 time > 6s	85.6
Tests with phase 1 time > 8s	87.0

## Feature selection

Reduce to 36 features

Accuracy of 82% using 10-fold CV and a randomforest model

Current related features were most telling

- Linearity of current
- Spikiness of current
- Curvature of current
- Maximum amplitude of the low frequency band of current

# Summary

Predict ignition before it happens
